                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a murine pituitary-derived ligand polypeptide CC which is a ligand for the G-protein coupled orphan receptor designated CC GPRIO (human) or UHR-1 (rat). Cells transformed with a vector containing CC the ligand polypeptide. The ligand polypeptide, and its fragments, modulate CC ligand polypeptide. The ligand polypeptide, and its fragments, modulate CC function of the pituitary, central nervous system, pancreas and other CC tissues and can be used to screen for agents that modulate binding of CC the polypeptide to the receptor; to quantify the amount of receptor in a CC sample and to raise antibodies. They may also be used therapeutically, CC e.g. to treat senile dementia; Alzhelmer's, Parkinson's or Huntington's CC diseases; Creutzfeld-Jakob disease; poloning by heavy metals or drugs; CC diseases; Creutzfeld-Jakob disease; poloning by heavy metals or drugs; CC diseases; schizophrenia; disorders of growth hormone secretion; cancer; CC operative nutritional status and as vasopressor. Transgenic animals C carrying the ligand polypeptide encoding DNA or lts mutein are used to CC study the function of the polypeptide-expressing genes, as models of CC disease, for drug screening and as source of cell lines. The ligand CC polypeptide DNA is used as a source of probes and primers; to identify C related sequences; in receptor-binding assays; for production of Ab and CC culotose with can be used for the propagation of activities of collections which can be used for the propagation of activities of collections which can be used for the propagation of activities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This peptide contains the partial C-terminal sequence of the synthetic ligand polypeptide 19p2-131 which is capable of binding to a G protein-coupled receptor protein. This peptide is used as an antigen to protein-coupled receptor protein. This peptide is used as an antigen to prepare rabbit anti-bovine 19p2-L31 antibodies which are used in binding assays. Pharmaceutical compositions containing this ligand may be used as a pituitary function modulator, a central nervous system modulator or a pancreatic function modulator. This ligand could have specific applications as a prophylactic or therapeutic agent for dementia, depression, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, trauma, growth hormone secretory disease, hyper-and polyphagia, hyperlipidaemia, hypercholesterolaemia, hyperglyceridaemia, hypercholesters, cancer, pancreatitis, remail disease, Turner's syndrome, neurosis, asthma, rheumatoid arthritis, spinot injury, translent brain ischaemia, epilepsy, amylotrophic lateral scherosis, acute myocardial infarction, infertility, spinoterebellar and of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of the procession of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAW97229-31 represent a ligand polypeptide derived fragments used to produce antibodles. The specification describes an agent for modulating prolactin secretion which comprises a ligand polypeptide or a salt, for a grotein-coupled receptor (GPCR) protein. The agents for promoting prolactin secretion can be used for treating or preventing thypocovarianism, gonecyst cacegenesis, menopausal syndrome, euthyroid or hypometabolism. They can by used for promoting lactation in a domestic mammal and as an aphrodisiac. The agents for inhibiting prolactin secretion can be used for treating or preventing prolacting secretion can be used for treating or preventing prolacting secretion can be used for treating or preventing prolactinomal, infertility, impotence, amenorrhea, galactorrhea, acromegaly, chiari-frommel syndrome, Argonz-del Castilo syndrome, Forbes-Albright Syndrome, Sheehan syndrome or dyszoospermia. The inhibitory cylentate can also be used as contraceptives. The agents for modulating placental function can be used for treating or preventing unthrifty chertagolism. Abnormal saccharometabolism.

The antibodies can be used in diagnosis or to treat or prevent diseases associated with abnormality in the pituitsry function regulatory mechanism (e.g. promotion of prolactin secretion), central nervous regulatory mechanism, and pancreatic function regulatory mechanism. The antibody-based immunoassay can also be applied in clarifying the physiological functions of the ligand and its derivative. sequences aaX49290-302 represent peptide fragments of the 19P2 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New monoclonal antibodies, studying diseases related

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
```

The invention provides a monoclonal antibody which has a specific reaction with the part peptide of the C-terminal of 1992 ligand or derlyative. The antibodies can be used in diagnosis or to treat or prevent diseases sssociated with abnormality in the pitultary func

function

                                                                                   The invention provides a monocional antibody which has a specific reaction with the part peptide of the C-terminal of 1992 ligand or its derivative. The antibodies can be used in diagnosis or to treat or prevent diseases associated with abnormality in the pituitary function regulatory mechanism (e.g. promotion of prolactin secretion), central nervous regulatory mechanism, and pancreatic function regulatory mechanism. The antibody-based immunoassay can also be applied in clarifying the physiological functions of the ligand and its derivative. Sequences ANY49290-302 represent peptide fragments of the 1992 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 regulatory mechanism (e.g. promotion of prolactin secretion), central nervous regulatory mechanism, and pancreatic function regulatory mechanism. The antibody-based immunoassay can also be applied in clarifying the physiological functions of the ligand and its derivativ sequences ANY49290-302 represent peptide fragments of the 19P2 ligand.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ş
                                              CC This sequence represents a peptide fragment from a novel human type CC ligand polypeptide corresponding to amino acid residues 34 to 53 of the Sequence represented in AAW31390 and is used in an assay to monitor CC ligand binding to the G protein-Coupled receptor protein. Pharmaceutical CC compositions containing this ligand may be used as a pituitary function CC modulator, a central nervous system modulator or a pancreatic function CC modulator. This ligand could have specific applications as a CC prophylactic or therapeutic agent for dementia, depression, hyperkinetic CC syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, CC trauma, growth hormone secretory disease, hyper- and polyphagia, CC hyperlipidaemia, diabetes, cancer, pancreatitis, renal disease, CC Turner's syndrome, neurosis, asthma, rheumatoid arthritis, spinal injury, CC acute myocardial infarction, infertility, spinocerebellar degeneration, CC acute myocardial infarction, infertility, spinocerebellar degeneration, CC conspinactia, Assays can also be developed to screen compounds which are CC capable of altering the binding activity of the ligand affecting CC activation of the G protein-coupled receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         18-SEP-1996;

                                                                                                                                             CC ligand polypeptide corresponding to amino acid residues 33 to 52 of the CC sequence represented in AAW31383 and is used in an assay to monitor CC ligand binding to the G protein-coupled receptor protein. Pharmaceutical CC compositions containing this ligand may be used as a pituitary function CC modulator, a central nervous system modulator or a pancreatic function CC modulator. This ligand could have specific applications as a CC prophylactic or therapeutic agent for dementia, depression, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, CC trauma, growth hormone secretory disease, hyper- and polyphagia, CC hyperlipidaemia, hypercholesterolaemia, hyperglyceridaemia, cC furner's syndrome, neurosis, asthma, rheumatoid arthritis, spinal injury, CC Turner's syndrome, neurosis, asthma, rheumatoid arthritis, spinal injury, CC translent brain lschaemia, applepsy, amylotrophic lateral sclerosis, activation, CC consciousness, asthma, rheumatoid arthritis, spinal injury, CC acute myocardial infarction, infertility, spinocerebellar degeneration, CC consciousness can also be developed to screen compounds which are CC capable of altering the binding activity of the ligand affecting CC activation of the G protein-coupled receptor protein.

                      CC derived ligand corresponding to amino acid residues 34 to 53 of the CC sequence in AAN31368 and 18 used in an assay to monitor ligand binding CC to the G protein-coupled receptor protein. Pharmaceutical compositions CC central nervous system modulator or a pancreatic function modulator. a CC central nervous system modulator or a pancreatic function modulator. CC This ligand could have specific applications as a probplactic or CC therapeutic agent for dementia, depression, hyperkinetic syndrome, CC disturbance of consciousness, anxiety syndrome, schizophrenia, trauma, CC typercholesterolaemia, hyperglyceridaemia, hyperlipidaemia, hyperglyceridaemia, hyperlipidaemia, for the hormone secretory disease, hyper- and polyphagia, acute CC hyperprolactinemia, disbetes, cancer, pancreatitis, renal disease, hyperprolactinemia, diabetes, cancer, pancreatitis, spinal injury, CC transient brain ischaemia, amylotrophic lateral scierosis, acute myocardial infarction, spinocerebellar degeneration, bone fracture, trauma, atopic dermatitis, osteoporosis, asthma, epilepsy, infertillty CC and/or oligogalactia. Assays can also be developed to screen compounds which are capable of altering the binding activity of the ligand thus affecting activation of the G protein-coupled receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      18-SEP-1996;

                                                                                                                                                                                            fragment. It is used in the course of the invention. The specification classribes an agent for modulating prolactin secretion which comprises a ligand polypeptide or a sait, for a G protein-coupled receptor (GPCR) protein. The agents for promoting prolactin secretion can be used for treating or preventing hypocovarianism, gonecyst cacogenesis, menopausal syndrome, enthyroid or hypometabolism. They can by used for promoting lactation in a domestic mammal and as an aphrodislat. The agents for inhibiting prolactin secretion can be used for treating or preventing pluitary adenomatosis, brain tumour, emmenipathy, autoimmune disease, prolactinoma, infertility, impotence, amenorrhea, galactorrhea, carcomegaly, Chiari-frommel syndrome, Argonz-del Castilo syndrome, for modulating placental function can be used for treating or preventing chalbitory agents can also be used as contraceptives. The agents for modulating placental function can be used for treating or preventing chalbitory agents can also be used as contraceptives. The agents for modulating placental function can be used for treating or preventing chalbitory agents can also be used as contraceptives. The agents for modulating placental function can be used for treating or preventing chalbitory agents can also be used as contraceptives. The agents for modulating placental function can be used for treating or preventing chalbits.
                                                                                                        Query Match

The present sequence represents a rat type ligand fragment. It is used in the course of the invention. The specification describes a rate of the invention. The specification describes a can agent for modulating prolactin secretion which comprises a comprise a sait, for a g protein-coupied receptor (GPCR) comprises. The spents for promoting prolactin secretion can be used for creating or preventing hypowerianism, gonecyst cacogenesis, menopausal conditions, eathyroid or hypometabolism. They can by used for promoting contestion in a domestic mammal and as an aphrodisia. The agents for conditions in a domestic mammal and as an aphrodisia. The agents for conditions in a domestic mammal and as an aphrodisia. The agents for conditions, infertility, impotence, amenorabea, autolumnne disease, corposes-Albright syndrome, lymphoma, sheehan syndrome or dyszoospermia. The inhibitory agents can also be used for treating or preventing conditions ting placental function can be used for treating or preventing conditions, hydatid mole, irruption mole, abortion, unthrifty fetus, abnormal saccharometabolism, abnormal lipidmetabolism or oxytocia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       G protein-coupled receptor; GPCR; hypocovarianism; gonecyst cacogenesis; menopausal syndrome; euthyrold; hypometabolism; lactation, pituitary adenomatosis; brain tumour; emmenlopathy; autoimmune disease; prolactinoma; infertility; impotence; amenorrhea; galactorrhea; acromegaly; Chiari-Frommel syndrome; Argonz-del Castilo syndrome; Forbes-Albright syndrome; lymphoma; Sheehan syndrome; dyszoospermia; contraceptive; placental function; chorlocarcinoma; hydatid mole; inruption mole; abortion; unthrifty fetus; abnormal saccharometabolism; oxytocia.
                                                                                                                                                                                                                                                                                                                                                                                         Claim 3;
                                                                                                                                                                                                                                                                                                                                                                                                                       Use of G protein-coupled receptor ligands - for modulating prolactin secretion or placental function, e.g. for treating menopausal syndrome, tumours, autoimmune disease or abnormal pregnancy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 30-DEC-1998

CC which is a ligand for the e-protein coupled orphan receptor designated CC GPR10 (human) or UHR-1 (rat). Cells transformed with a vector containing CC the ligand polypeptide encoding DNA are used to produce a recombinant CC ligand polypeptide. The ligand polypeptide, and its fragments, modulate CC function of the pituitary, central nervous system, pancreas and other CC tissues and can be used to screen for agents that modulate binding of the CC polypeptide to the receptor; to quantify the amount of receptor in a CC sample and to raise antibodies. They may also be used therapeutically, CC e.g. to treat senile dementia; Alzheimes's, Parkinson's or Huntington's CC diseases; Creutzfeld-Jakob disease; poisoning by heavy metals or drugs; CC diseases; Schizophrenia; disorders of growth hormone secretion: cancer; CC rhemmatol arthritia, epilepsy and many others, also to improve post-CC operative nutritional status and as vasopressor. Transgenic animals CC carrying the ligand polypeptide encoding DNA or its mutein are used to study the function of the polypeptide expressing genes, as models of CC study the function of the polypeptide expressing genes, as models of CC disease, for drug screening and as source of cell lines. The ligand CC polypeptide DNA is used as a source of cell lines. The ligand CC animals. The present sequence represents a bovine genome-derived ligand colypeptide fragment which is similar to the murine ligand-polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 13

                                                                                                The invention relates to a murine pituitary-derived ligand polypeptide CC which is a ligand for the G-protein coupled orphan receptor designated CC GPR10 (human) or UHR-1 (rat). Cells transformed with a vector containing CC the ligand polypeptide encoding DNA are used to produce a recombinant CC ligand polypeptide. The ligand polypeptide, and its fragments, modulate CC function of the pituitary central nervous system, pancreas and other CC tissues and can be used to screen for agents that modulate binding of CC the polypeptide to the receptor; to quantify the amount of receptor in a CC sample and to raise antibodies. They may also be used therapeutically, CC e.g. to treat senile dementie; Alzheimer's, Parkinson's or Huntington's CC diseases: Creutzfeld-Jakob disease; poisoning by heavy metals or drugs; CC diseases: Creutzfeld-Jakob disease; poisoning by heavy metals or drugs; CC diseases; schizophrenia; disorders of growth hormone secretion; cancer; CC crarying the ligand polypeptide encoding DNA or its mutein animals CC carrying the ligand polypeptide encoding DNA or its mutein are used to study the function of the polypeptide-expressing genes, as models of CC study the function of the polypeptide-expressing genes, as models of CC disease, for drug screening and as source of cell lines. The ligand CC cantisers; in drug development; for gene therapy and to develop continued as a force of probes and primers; to identify continued as which can be used for the preparation of anti-ligand polypeptide cantisers; in sequences and states and primers and polypeptide cantisers; to identify continued as a source of cell lines. The ligand continued as a source of cell lines. The ligand continued as a source of cell lines are discussed to continue the sequences and states and primers; to identify continued as a source of cell lines. The ligand continued to development and sequences and sequences and sequences and sequences and sequences and sequences and sequences and sequences and sequences and sequences and sequences and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 14

                                                                                                                                              This invention describes a novel oxytocin secretion-regulating agent which contains a ligand peptide or its sait for the 6 protein-coupled receptor protein. It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placenta, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and plg. This sequence represents a bowlne paptide which acts as an oxytocin secretion
                                                                                                                                                                                                                                                                                                           Physiologically-active polypeptide recognized as ligand by G protein-coupled receptor protein, for promoting secretion of oxytocin, as drugs for diseases relating to oxytocin secretion and in veterinary
                                                                                                                                                                                                                                                                                                                                                               WPI;

RESULT
AAW31400
  cc which is a ligand for the 6-protein coupled orphan receptor designated coupled that ligand polypeptide encoding DNA are used to produce a recombinant ct ligand polypeptide. The ligand polypeptide, and its fragments, modulate cf function of the pituitary, central nervous system, pancreas and other ct issues and can be used to screen for sgents that modulate binding of the polypeptide to the receptor; to quantify the amount of receptor in a csample and to raise antibodies. They may also be used therspeutically, cc. e.g. to treat senile dementia; Alzhelmer's, Parkinson's or Huntington's cd diseases; creutafeld-Jakob disease; poisoning by heavy metals or drugs; cd diseases; creutafeld-Jakob disease; poisoning by heavy metals or drugs; coperative nutritional status and as vasopressor. Transgenic animals carrying the ligand polypeptide encoding DNA or its mutein are used to study the function of the polypeptide expressing genes, as models of cd isease, for drug screening and as source of cell lines. The ligand coplypeptide bNA is used as source of probes and primers; to identify created sequences; in receptor-binding assays; for production of Ab and creative parking the ligand sequences AAM95174 to AAW95178 represent antigenic antigenic antigenic animals. Sequences AAM95174 to AAW95178 represent antigenic senting.

   This peptide contains the partial C-terminal sequence of the synthetic CC ligand polypeptide 1992-131 which is capable of binding to a G CC propare rabbit anti-bovine 1992-131 antibodies which are used in binding CC propare rabbit anti-bovine 1992-131 antibodies which are used in binding CC assays. Pharmaceutical compositions containing this ligand may be used as a pituitary function modulator, a central nervous system modulator or a pancreatic function modulator. This ligand could have specific CC applications as a prophylactic or therapeutic agent for dementia, CC depression, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, trauma, growth hormone secretory disease, CC hyper and polyphagia, hyperilpidaemia, hypercholesterolaemia, the prophylactinaemia, diabetes, cancer, pancreatitis, CC hyperglyceridaemia, hyperprolactinaemia, diabetes, cancer, pancreatitis, CC sphal disease, Turner's syndrome, neurosis, asthma, rheumatoid arthritis, CC sphal injury, transient brain ischaemia, epilepsy, amylotrophic lateral CC degeneration, bone fracture, trauma, atopic dermatitis, osteoporosis cand/or oligogalactia. Assays can also be developed to screen compounds which are capable of altering the binding activity of the ligand CC affecting activation of the G protein-coupled receptor protein.

                        regulatory mechanism (e.g. promotion of prolactin secretion), central nervous regulatory mechanism, and pancreatic function regulatory mechanism. The antibody-based immunoassay can also be applied in clarifying the physiological functions of the ligand and its derivative sequences ANY49290-302 represent peptide fragments of the 19P2 ligand
   The invention provides a monoclonal antibody which has a specific reaction with the part peptide of the C-terminal of 192 ligand or its derivative. The antibodies can be used in diagnosis or to treat or prevent diseases associated with abnormality in the pituitary function

  The invention relates to a murine pituitary-derived ligand polypeptide which is a ligand for the G-protein coupled orphan receptor designated CC GPR10 (human) or UHR-1 (rat). Celis transformed with a vector containing CC the ligand polypeptide encoding DNA are used to produce a recombinant CC ligand polypeptide. The ligand polypeptide, and its fragments, modulate CC function of the pituitary, central nervous system, pancreas and other CC tissues and can be used to screen for agents that modulate binding of the CC polypeptide to the receptor; to quantify the amount of receptor in a CC sample and to raise antibodies. They may also be used therapeutically, CC e.g. to treat senile dementia; Alzhelmer's, Parkinson's or Huntington's CC diseases; Creutzield-Jakob discase; polsoning by heavy metals or drugs; CC disbetes; schizophrenia; discorders of growth hormone secretion; cancer; CC mounatoid arthritis, eplicpsy and many others, also to improve post-CC diseases; for idea to study the function of the polypeptide ecoding DNA or its mutein are used to carrying the ligand polypeptide ecoding DNA or its mutein are used to catudy the function of the polypeptide expressing genes, as models of CC disease, for drug screening and as source of cell lines. The ligand CC enthals. The present sequences for growth broads and primers; to identify contained to the polypeptide expressing genes. The ligand CC enthals. The present sequences for growth seasons and primers; to identify contained to the properties of probes and primers; to identify contained to the properties of probes and primers. The ligand contained to the properties of probes and primers to identify contained to the properties of probes and primers.
                              antisera; in drug development; ror yene cherry and animals. The present sequence represents a bowine genome-derived ligand polypeptide fragment which is similar to the murine ligand-polypeptide.

MEDLIHE-98268781;
  Hormone;
   -1- FUNCTION: Stimulates prolactin (PRL) release and regulates the
expression of prolactin through its receptor GPR10. May stimulate
iactotrophs directly to secrete PRL.
iactotrophs directly: MEDULLA OBLONGATA AND NYPOTHALAMUS.

   and comprising a sequence ($2); (2) a diagnostic method based on antisera comparison as sequence ($2); (2) a diagnostic method based on antisera against prap20 for identification of disorders involving the central concerns prapagation of autonomic conservations system, including those associated with pain or autonomic regulation, where specific antisera against the N-and/or C-terminal commands of prap is used to identify alterations in prap synthesis or conservations; (3) a rat or human receptor encoded by a 1122 nucleotide sequence ($3), fully defined in the specification; (4) treating a person suffering from a disorder regulated by a receptor (II) encoded by a sequence of 1122 nucleotide sequence, fully defined in the specification, located in the contrain nervous system, by administering an agonist or antegonist to the receptor; and (5) treating blood pressure, by blocking of receptors of the reventue system by administering and hypotensive activity. The products of the invention have analgesic and hypotensive activity. C1) is useful for regulating autonomic functions, such as increasing biood pressure. (1) is useful for treating pain, for manufacturing a medicament for regulating blood pressure, and for treating pain. Agonist and anteropathic pain, for regulating autonomic functions and

   å
  cc which is a ligand for the G-protein coupled orphan receptor designated Cd GPRLO (human) or UHR-1 (rat). Cells transformed with a vector containing ct the ligand polypeptide encoding DNA are used to produce a recombinant cd (ligand polypeptide. The ligand polypeptide, and its fragments, modulate cf function of the pituitary, central nervous system, pencreas and other ctissues and can be used to screen for agents that modulate binding of ct the polypeptide to the receptor; to quantify the amount of receptor in a csample and to raise antibodies. They may also be used therapeutically, ce. 9. to treat senile dementia; Alzheimer's, Parkinson's or Huntington's cd diseases; Creutzfedd-Jakob diseases; poisoning by heavy metals or drugs; cd diseases; schizophrenia; disorders of growth hormone secretion; cancer; cremmatoid arrhritis, epilepsy and many others, also to improve post-coperative nutritional status and as vasopressor. Transgenic animals carrying the ligand polypeptide encoding DNA or its mutein are used to study the function of the polypeptide encoding DNA or its mutein are used to carrying the ligand polypeptide encoding DNA or its models of cc study the function of the polypeptide encoding polypens, as models of cc study the function of the polypeptide encoding polypens, as models of cc study the function of the polypeptide encoding polypens, as models of cc study the function of the polypeptide encoding polypeptide. The polypeptide encoding polypept

  The present sequence represents a bovine pituitary-derived ligand fragment. It is used in the course of the invention. The specification describes an agent for modulating prolactin secretion which comprises a ligand polypeptide or a salt, for a g protein-coupled receptor (GPCR) protein. The agents for promoting prolactin secretion can be used for treating or preventing hypocovarianism, genecyst cacogenesis, menopausal syndrome, euthyroid or hypometabolism. They can by used for promoting lactation in a domestic mammal and as an aphrodisia. The agents for inhibiting prolactin secretion can be used for treating or preventing pituitary ademomatosis, brain tumour, emmeniopathy, autoimmune disease, prolactinoma, infertility, impotence, amenorihas, galactorrhes,

The present sequence represents a rat type ligand fragment. It is used in the course of the invention. The specification describes a period of the invention. The specification describes in agent for modulating prolactin secretion which comprises a comprises a comprise and the protein. The agents for promoting prolactin secretion can be used for treating or preventing hypowarianism, gonecyst cacogenesis, menopausal syndrome, euthyrold or hypometabolism. They can by used for promoting contextion in a domestic mammal and as an aphrodisia. The agents for continiting prolactin secretion can be used for treating or preventing continiting prolactinomal secretion can be used for treating or preventing continiting prolactinoma, infertility, impotence, amenorrhea, autoimmune disease, prolactinoma, infertility, impotence, amenorrhea, galactorrhea, coromegaly, chlari-grommel syndrome, Argonz-del Castilo syndrome, composition, and the syndrome or dyszoospermia. The inhibitory agents can also be used as contraceptives. The agents for modulating placental function can be used for treating or preventing continuating placental function can be used for treating or preventing continuation, hydatid mole, liruption mole, abortion, unthrifty fetus, abortman associations.
   Use of G protein-coupled receptor ilgands - for modulating protactin secretion or placental function, e.g. for treating menopausal syndrome, tumours, autoimmune disease or abnormal pregnancy

AAW97236
The present sequence represents a human type ligand fragment. It is used in the course of the invention. The specification describes an agent for modulating prolactin secretion which comprises a ligand polypeptide or a salt, for a g protein-coupled receptor (GPCR) protein. The agents for promoting prolactin secretion can be used for treating or preventing hypowerialnism, generyst cacegenesis, menopausal syndrome, euthyroid or hypometabolism. They can by used for promoting inhibiting prolactin secretion can be used for treating or preventing pilutitary adenomatosis, brain tumour, emmeniopathy, autoimmune disease, prolactinoma, infertility, impotence, amenorrhea, galactorrhea, coromegaly, Chiari-Frommel syndrome, Argonz-del Castilo syndrome, for The inhibitory agents can also be used for treating or preventing choriccarcinoma, hydatid mole, irruption mole, abortion, unthrifty fetus, abnormal saccharometabolism, abnormal lipidmetabolism or oxytocla.

                           The invention relates to a murine pituitary-derived ligand polypeptide CC which is a ligand for the G-protein coupled orphan receptor designsted CC GPRIO (human) or UHR-1 (rat). Cells transformed with a vector contsining CC the ligsnd polypeptide encoding DNA sre used to produce a recombinant CC ligand polypeptide. The ligand polypeptide, and its fragments, modulate CC function of the pituitary, central nervous system, pancreas and other CC tissues and can be used to screen for agents that modulate binding of the polypeptide to the receptor; to quantify the amount of receptor in a CC sample and to raise sntibodies. They may also be used therapeutically, CC e.g. to treat senile dementia; Alzhelmer's, Parkinson's or Huntington's CC disease; Creutrfeld-Jakob disease; poisoning by heavy metals or drugs; CC disbetes; schizophrenia; disorders of growth hormone secretion; cancer; CC creative nutritionsl status and as vasopressor. Transgenic animals CC carrying the ligand polypeptide encoding DNA or its mutein are used to catudy the function of the polypeptide expressing genes, as models of CC disease, for drug screening and as source of cell lines. The ligand CC polypeptide sequences; in receptor-binding assays; for production of Ab and CC polypeptide fragment which is similar to the murine ligand-polypeptide.

CC animals. The present sequence represents s bovine genome-derived ligand CC polypeptide fragment which is similar to the murine ligand-polypeptide.

CC which is a ligand for the grant coupled orphan receptor designsted CC GPR10 (human) or UHR-1 (rat). Cells transformed with a vector containing Ct the ligand polypeptide encoding DNA are used to produce a recombinant CC ligand polypeptide. The ligand polypeptide, and its fragments, modulate CC function of the pituitary, central nervous system, pancreas and other Ct issues and can be used to screen for sgents that modulate binding of CC the polypeptide to the receptor; to quantify the amount of receptor in a CC sample and to raise antibodies. They may also be used therapeutically, CC e.g. to treat senile dementia; Alzheimer's, Parkinson's or Huntington's CC diseases; Creutzfeld-Jakob disease; poisoning by heavy metals or drugs; CC diseases; Schizophrenia; disorders of growth hormone secretion; csncer; CC rheumatoid arthritis, epilopsy and msny others, also to improve post-coperative nutritional status and ass vasopressor. Transgenic animals CC carrying the ligand polypeptide encoding DNA or its mutein are used to study the function of the polypeptide-expressing genes, as models of CC disease, for drug screening and as source of cell lines. The ligand CC polypeptide bNA is used as a source of cell lines. The ligand CC related sequences; in receptor-binding sasays; for production of Ab and CC antisers; in drug development; for gene therspy snd to develop continues which can be used for the preparation of anti-ligand polypeptide entity continues which can be used for the preparation of anti-ligand polypeptide.

  CATALYTIC ACTIVITY: Thiosulfate + cyanide - sulfite + thiocyana SUBGUIT: MQNOMER.

SUBCELLULAR LOCATION: Mitochondrial matrix.

TISSUE SPECIFICITY: FOUND IN NUMEROUS TISSUES.

DOMAIN: THE STRUCTURE CONSISTS OF 2 DOMAINS OF VERY SIMILAR COMPORMATION, SUGGESTING A COMMON EVOLUTIONARY ORIGIN. HOWEVER, THE SEQUENCES OF THE 2 DOMAINS ARE VERY DIFFERENT.

SIMILARITY: BELONGS TO THE RHODANESE FAMILY.

   C-terminal fragments of projections regulating sutonomic functions for regulating blood pressure
  Pitultary-derived llgand polypeptide: G-protein coupled orphan receptor; GPR10; UHR-1: modulator; pitultary; central nervous system; pancreas; tlssue: screen; therapeutic; binding: senile dementia: iligand; murine: Alzhelmer's disease; Parkinson's disease; Huntington's disease; drug; Creutzfeld-Jakob disease; poisoning; schizophrenia; growth hormone;
   the central nervous system, by administering an agonist or antagonist to the receptor; and (5) treating blood pressure, by blocking of receptors of PrRP or its C-terminal fragment GlyileArgProValdlyArgPhe-NH.2 ($2). The products of the invention have analgesic and hypotensive sctivity. (I) is useful for regulating autonomic functions, such as increasing blood pressure. (I) is useful for treating psin, for manufacturing a medicament for regulating blood pressure, and for tresting psin. Agonist snd antagonist of (II) are useful for treating each inflammatory pain and neuropathic psin, for regulating autonomic functions and treating high blood pressure.
   prolactin-releasing peptide (PrRP), referred to as PrRP20 and having a sequence (S1). The invention also describes (i) a therapeutic composition (C1) comprising (I) or s C-termins! fragment of PrRP referred to as PrRP8 and comprising (I) or s C-termins! fragment of PrRP referred to as PrRP8 and comprising a sequence (S2); (2) a diagnostic method based on antisera against PrRP20 for identification of disorders involving the central nervous system, including those associated with pain or autonomic regulation, where specific sntisers against the N-and/or C-terminal domains of PrRP is used to identify alterations in PrRP synthesis or levels; (3) a rst or human receptor encoded by a 1122 nucleotide sequence (S3), fully defined in the specification; (4) treating a person suffering from a disorder regulated by a receptor (II) encoded by a sequence of the control of the specification, located in the specification of the specifi

   GPRIO (human) or UHR-1 (rat). Cells transformed with a vector containing Ct the ligand polypeptide. The ligand polypeptide, and its fragments, modulate ligand polypeptide. The ligand polypeptide, and its fragments, modulate Ct function of the pitultary, central nervous system, pancress and other Ct tissues and can be used to screen for agents that modulate binding of Ct the polypeptide to the receptor; to quantify the amount of receptor in a CC sample and to raise antibodies. They may also be used therspectically, CC e.g. to treat senile dementia: Alzheimer's, Parkinson's or Huntington's CC diseases; Creutzfeld-Jskob disease; polsoning by heavy metals or drugs: CC diseases; creutzfeld-Jskob disease; polsoning by heavy metals or drugs: CC operative nutritional status and as vasopressor. Transgenic animals carrying the ligand polypeptide encoding DNA or its muten) are used to corrying the function of the polypeptide-expressing genes, as models of cidease, for drug screening and as source of cell lines. The ligand CC oplypeptide DNA is used as source of cell lines. The ligand CC oplypeptide DNA is used as source of cell ines. The ligand CC related sequences; in receptor-binding assays; for production of Ab and CC transgenic animals. Sequences AMW95174 to AAW95178 represent antiqenic contains.

S
   This peptide contains the partial C-terminal sequence of the synthetic CC ligand polypeptide 1992-131 which is capable of binding to a GC protein-coupled receptor protein. This peptide is used as an antigen to CC prepare rabbit anti-bovine 1992-131 antibodies which are used in binding CC assays. Pharmaceutical compositions containing this ligand may be used CC as a pituitary function modulator, a central nervous system modulator CC or a pancreatic function modulator. This ligand could have specific CC applications as a prophylactic or therapeutic agent for dementla, CC depression, hyperkinetic syndrome, disturbance of consciousness, anxiety CC syndrome, achizophrenia, trauma, growth hormone secretory disease, CC hyper-and polyphagia, hyperripidaemia, hypercholesterolaemia, containing the secretory disease, CC hyperglyceridaemia, hyperrolactinaemia, dishetes, cancer, pancreatitis, CC spinal disease, Turner's syndrome, neurosis, asthma, rheumatold arthritis, CC spinal injury, transient brain ischaemia, epilepsy, amylotrophic lateral CC elecosis, acute myocardial infarction, infertility, spinocerebellar CC end/or oligogaiactia. Asaays can also be developed to screen compounds which are capable of altering the binding activity of the ligand CC which are capable of altering the binding activity of the ligand

  AAW97229-31 represent a ligand polypeptide derived fragmenta used to produce antibodies. The specification describes an agent for modulating product antibodies. The specification describes an agent for modulating prolactin secretion which comprises a ligand polypeptide or a mait, for a grotein-coupled receptor (GPCR) protein. The agenta for promoting prolactin secretion can be used for treating or preventing thypocovarianism, gonecyst cacegenesis, menepausal syndrome, euthyroid or hypometabolism. They can by used for promoting lactation in a domestic mammal and as an aphrodialac. The agents for inhibiting prolactin accretion can be used for treating or preventing pituitary adenomatosis, infertility, impotence, amenorabes, galactorabes, acromegaly, brain tumour, emmenlopathy, autolamune disease, prolactionma, charlest can also be used as contraceptives. The agents for modulating placental function can be used for treating or preventing contractions, hydatid mode, irruption mode, abortion, unthrifty absorbed as contraceptives. The agents for modulating placental function can be used for treating or preventing.

                         The present sequence represents a human type ligand fragment. It

CC is used in the course of the invention. The specification describes

CC an agent for modulating prolactin secretion which comprises a

CC ligand polypeptide or a salt, for a G protein coupled receptor (GPCR)

CC protein. The agents for promoting prolactin secretion can be used for

CC treating or preventing hypoovarianism, gonecyst cacogenesis, menopausal

CC syndrome, euthyroid or hypometabolism. They can by used for promoting

CC lactation in a domestic mammal and as an aphrodistac. The agents for

CC inhibiting prolactin secretion can be used for treating or preventing

CC pituitary adenomatosis, brain tumour, emmeniopathy, autoimmune disease,

CC protes-Albright syndrome, lymphome, Argonz del Castilo syndrome,

CC rorbes-Albright syndrome, lymphome, Argonz del Castilo syndrome,

CC modulating placental function can be used for treating or preventing

CC chorlocarcinoma, hydatid mole, irruption mole, abortion, unthrifty fetus,

CC abnormal saccharometabolism, abnormal ilpidmetabolism or oxytocia.
   G protein-coupled receptor; GPCR; hypocovarianism; gonecyst cacogenesis; menopausal syndrome; euthyroid; hypometabolism; lactation; pituitary adenomatosis; brain tumour; emmeniopathy; autoimmune disease; prolactinoma; infertility; impotence; amenorrhea; galactorrhea; acromegaly; Chiari-Frommel syndrome; Argonz-del Castilo syndrome; Forbes-Albright syndrome; lymphoma; Sheehan syndrome; dyscoospormia; contraceptive; placental function; choriocarcinoma; hydatid mole; abortion; unthrifty fetus; abnormal saccharometabolism; oxytocia.
   Use of G protein-coupled receptor ligands - for modulating prolactin secretion or placental function, e.g. for treating menopausal syndrome, tumours, autoimmune disease or abnormal pregnancy

AAW95191
which is a ligand for the G-protein coupled orphan receptor designated CC GPRIO (human) or UHR-1 (rat). Cells transformed with a vector containing the ligand polypeptide encoding but are used to produce a recombinant CC ligand polypeptide. The ligand polypeptide, and its fragments, modulate CC function of the pituitary, central nervous system, pancreas and other tissues and can be used to screen for agents that modulate binding of the CC polypeptide to the receptor; to quantify the amount of receptor in a CC sample and to raise antibodies. They may also be used therapeutically, CC e.g. to treat senile dementia; Alzheimer's, Parkinson's or Huntington's CC diseases; Creutzfeld-Jakob disease; poisoning by heavy metals or drugs; CC diseases; Creutzfeld-Jakob disease; poisoning by heavy metals or drugs; CC diseases; chizophrenia; disorders of growth hormone secretion; cancer; CC operative nutritional status and as vasopressor. Transgenic animals CC carrying the ligand polypeptide encoding DNA or its mutein are used to study the function of the polypeptide-expressing genes, as models of CC disease, for drug screening and as source of cell lines. The ligand CC polypeptide DNA is used as a source of cell lines. The ligand CC related sequences; in receptor-binding assays; for production of Ab and continued to the colon of Ab and continued to the colon of Ab and colon of the colon of

   The invention relates to a murine pituitary-derived ligand polypeptide CC which is a ligand for the G-protein coupled orphan receptor designated CC GPR10 (human) or UHR-1 (rat). Cells transformed with a vector containing CC the ligand polypeptide encoding DNA are used to produce a recombinant CC ligand polypeptide. The ligand polypeptide, and its fragments, modulate CC function of the pituitary, central nervous system, pancreas and other CC tissues and can be used to screen for agents that modulate binding of the polypeptide to the receptor; to quantify the amount of receptor in a CC sample and to raise antibodies. They may also be used therapeutically, CC e.g. to treat senile dementia; Alzhalmer's, Parkinson's or Huntington's CC diseases; Creutzfeld-Jakob disease; poisoning by heavy metals or drugs; CC diseases; Creutzfeld-Jakob disease; poisoning by heavy metals or drugs; CC diseases; Creutzfeld-Jakob disease; poisoning by heavy metals or drugs; CC diseases; contributed and as vasopressor, Transgenic animals CC carrying the ligand polypeptide encoding DNA or its mutein are used to study the function of the polypeptide-expressing genes, as models of CC disease, for drug screening and as source of cell lines. The ligand CC related sequences; in receptor-binding assays; for production of Ab and CC related sequences; in receptor-binding assays; for production of Ab and CC antisera; in drug development; for gene therapy and to develop captor before which can be used for the preparation of anti-ligand polypeptide.

CC captibodes which can be used for the preparation of anti-ligand polypeptide.
